

COMMERCIAL  
WINDOW SHIELD

how can  
window Film

PREVENT

A VIOLENT  
SCHOOL ATTACK?

# window film can buy precious response time.

## **Maybe it's only a minute or so.**

But in those first critical minutes, think about what positive steps can take place to secure the school's teachers and children.

- Preplanned and rehearsed security protocols can be put into effect.
- School security has the opportunity to deploy and position for lock-down.
- 9-1-1 First Responders have that "extra" time to effectively intervene.

Window Film can act as a deterrent by denying immediate entry; possibly eliminating the threat altogether.

# Commercial Window Shield has a long history of installing specialized security window films on many of our nation's most historic structures and popular landmarks.

For the most part, our projects are implemented to secure sensitive buildings described as vulnerable to terrorist attacks (see listing on back panel) due to their populations or their affiliations. Today, the unfortunate and deadly incidents of school invasions have given rise to the need for our services to protect our nation's schools.

## security window film simply explained

Security Window Films, also known as Fragment Retention Window Films are designed to increase the shatter resistance of glass. They are similar to regular window films in that they are polyester laminates but they are usually thicker and use a heavier, more aggressive adhesive system. Offered in thicknesses ranging from 4 to 21 mils, security films are often chosen for buildings deemed susceptible to tornadoes, hurricanes, explosions and/or forced intrusions.

These films are available in clear or a variety of tinted, solar energy-reflective versions to get not only the benefit of increased glass strength and security but to conserve energy and make the building more comfortable.

## the film is only half the answer

In order to fully establish a protective perimeter and secure potential access points, Commercial Window Shield specifies the integration of an attachment system to work in conjunction with a properly selected security film.

The attachment system recommended is called a four-sided wet glazed system. This high strength system involves the application of the film to the glass first and then a silicon adhesive material is applied that secures the film to the frame all the way around the opening.

The combination of the film and the attachment system is what is required in order to effectively obstruct an intruder from entering.
